**TRADING SIMULATOR**

**BECOME A VIRTUAL TRADER**

Select the company that you would like to role-play - investigate your internal emission abatement curves and business-as-usual emissions forecasts - engage the trading engine - and trade away on CO2e.com's online Trading Simulation.

This Simulation is internet-delivered to you by CO2e.com and powered by eSpeed -- the institutional trading engine that manages the exchange of US\$150 billion in global commodities and government securities daily.

The Trading Simulation is designed to develop an understanding of the operation of a more commoditised carbon market and determine how policy decisions may impact this emerging marketplace.

No public simulations are currently scheduled. Please consult this page regularly for updates.

**Click [here](#) to run the simulation (if a simulation is scheduled or currently running).**

NOTE: The Trading Simulation has been tuned for the Microsoft Internet Explorer browser, version 5.0 and higher. Please use only this browser configuration to access the Simulation.

**TRADING SIMULATION PROVIDES:**

- an interactive simulation that models the impacts of key policy decisions that are currently in the regulatory debate
- a window into the possible future of the CO2e trading market
- a simulation that is equally engaging to carbon-constrained corporate interests, carbon reductions/offset suppliers, emission traders, consultants and advisors - novices and experts alike.

However, the CO2e Trading Simulation does not provide either a conclusive prediction of the clearing price of carbon, or an analysis of the macro-economic impacts of the Kyoto flexibility mechanisms.

With a clear understanding of the intent of this tool - enjoy the game - and may the best trader WIN!

To participate in the Trading Simulation, you must be registered as a CO2e.com Trading Member or Virtual Trader.

Click [here](#) to review your CO2e.com registration options.

FIG. 7

## ABOUT THE SIMULATION

The Trading Simulation is one of a series of interactive trading tools that has been brought to market by CO2e.com.

The CO2e.com Trading Simulation is a platform to learn about the operation of a more commoditised carbon market, and the potential implications of major policy decisions on this emerging marketplace. It represents a simplified model of how international or domestic carbon trading might develop. The simulation combines many of the key elements of emerging policy with sophisticated trading technology from one of Wall Street's fastest growing B2B electronic solutions provider, eSpeed, Inc., to create a highly usable, enjoyable and instructive simulation.

### Broad Assumptions

Several key assumptions have been made in the design of CO2e.com's Trading Simulation. These assumptions are as follows:

- The simulated trading regime is one that could be established by an international interpretation of the Kyoto Protocol, with or without an advanced domestic trading environment
- All credit types are fully defined and transferable across international boundaries
- Participants in Non-Annex B countries can sell and buy credits

It is important to recognise these assumptions before engaging the Simulation.

### Simulation Elements

Four different types of entities participate in the simulation, each with different characteristics and goals:

**BUYERS** face caps on their carbon dioxide equivalent (CO2e) emissions and must undertake internal actions and may engage in trading to comply with emissions targets at the least cost and avoid compliance penalties.

**SUPPLIERS** are capable of producing Joint Implementation (JI) or Clean Development Mechanism (CDM) credits and attempt to maximise profit from the sale of these credits.

**TRADERS** take speculative positions in the market for profit through the careful analysis of late-breaking news and the observation of market behaviour. Traders add liquidity to the market.

**NGOs** seek to achieve the greatest environmental "good" at the least economic cost by purchasing and holding on to credits for ultimate retirement with limited economic resources.

The participants are located in one of three fictitious countries. Narnia and Utopia are both Annex B (capped) nations. The BUYERS and TRADERS are exclusively located in these countries. The single non-Annex B country, Gondwana, is home to roughly two-thirds of the SUPPLIERS, with the rest located in the capped nations.

**BUYERS** are assigned Emissions Allowances (EAs) after a defined "announcement year" for use during the commitment period. EAs are tradeable. Internal Reductions (IRs) are created by BUYERS undertaking emission reduction or sequestration projects internally; these reductions are not tradeable.

**SUPPLIERS** create CDM or JI credits, depending on the jurisdictions on which they are located. Credits are distinguished by vintage (year) and while credits may be banked for future use (depending on the particular "rules" of each credit type), they may not be borrowed for prior year compliance.

About the simulation 836

Please make a selection of the organisation that you wish to "role-play" during the course of this simulation by following these simple steps:

- 1- select one organisation from the list of user types (BUYER, SUPPLIER, TRADER, or NGO), below
- 2- review the details of that organisation by selecting the 'view' option
- 3- continue this process until you are comfortable with the organisation selected
- 4- choose the appropriate organisation by clicking 'select' on the 'Select Organisations' page
- 5- Select to either keep the default name of the organisation, or create your own name

NOTE: the system will automatically ensure that there is a relative balance between the participant types (BUYER, SUPPLIER, TRADER, and NGO). If you receive an error message on selection of a particular participant type, please select from one of the remaining three.

For a more detailed definition of the participant types, see the simulation demo>>

The origination utility is provided to allow participants to generate credits (for SUPPLIERS) or internal reductions (IRs) (for BUYERS).

To originate credits or IRs, please take the following simple steps:

- 1 Input the total amount of tonnes that you would like to produce over the 10-year lifespan of your project in the 'TOTAL VOLUME' field below
- 2 Click 'CALCULATE' to determine the total cost for this origination (total cost is a function of your organisation's MARGINAL ABATEMENT/SUPPLY COST curve)
- 3 Click 'ACCEPT' (only once) if you wish to originate the credits or IRs, or 'CANCEL' to reset the origination utility

1204

REMEMBER: the total volume of credits or IRs will be spread over the lifespan of your project (10 years), so 1/10th of the total volume amount will be assigned to each year. If the origination reaches past the end of the Commitment Period, the credits or IRs will be assigned as 'POST 2012' tonnes and will be valued as an asset at the end of the Simulation.

## ABOUT THE SIMULATION

The Trading Simulation is one of a series of interactive trading tools that has been brought to market by CO2e.com.

The CO2e.com Trading Simulation is a platform to learn about the operation of a more commoditised carbon market, and the potential implications of major policy decisions on this emerging marketplace. It represents a simplified model of how international or domestic carbon trading might develop. The simulation combines many of the key elements of emerging policy with sophisticated trading technology from one of Wall Street's fastest growing B2B electronic solutions provider, eSpeed, Inc., to create a highly usable, enjoyable and instructive simulation.

### Broad Assumptions

Several key assumptions have been made in the design of CO2e.com's Trading Simulation. These assumptions are as follows:

- The simulated trading regime is one that could be established by an international interpretation of the Kyoto Protocol, with or without an advanced domestic trading environment
- All credit types are fully defined and transferable across international boundaries
- Participants in Non-Annex B countries can sell and buy credits

It is important to recognise these assumptions before engaging the Simulation.

### Simulation Elements

Four different types of entities participate in the simulation, each with different characteristics and goals:

**BUYERS** face caps on their carbon dioxide equivalent (CO2e) emissions and must undertake internal actions and may engage in trading to comply with emissions targets at the least cost and avoid compliance penalties.

**SUPPLIERS** are capable of producing Joint Implementation (JI) or Clean Development Mechanism (CDM) credits and attempt to maximise profit from the sale of these credits.

**TRADERS** take speculative positions in the market for profit through the careful analysis of late-breaking news and the observation of market behaviour. Traders add liquidity to the market.

NGOs seek to achieve the greatest environmental "good" at the least economic cost by purchasing and holding on to credits for ultimate retirement with limited economic resources.

The participants are located in one of three fictitious countries. Narnia and Utopia are both Annex B (capped) nations. The **BUYERS** and **TRADERS** are exclusively located in these countries. The single non-Annex B country, Gondwana, is home to roughly two-thirds of the **SUPPLIERS**, with the rest located in the capped nations.
